Eran Toledo, PhD

BSP Inc.

Tel Aviv, Israel

Dear Dr. Toledo:

I am writing to provide you with feedback regarding the HyperQ system which was installed at UCSD a few months ago. We have been working with the system on a routine basis in the Nuclear Cardiology and Exercise Testing Facility at our main hospital, UCSD Medical Center, Hillcrest. Our center performs over 1200 nuclear stress tests per year in individuals with suspected and established coronary artery disease. The HyperQ System is also utilized for our pharmacologic stress testing. The system has been easy to use and has demonstrated excellent sensitivity and specificity. I am convinced that the HyperQ system offers an important advance in the diagnosis of ischemic heart disease.

The scientific basis of high frequency ECG analysis, implemented in the HyperQ system, has been established over the last two decades and includes animal studies and clinical studies in selected groups of patients. Clinical studies have shown the superiority of the HyperQ technology over standard ST segment analysis and our experience matches this. Particularly encouraging are the indications that the HyperQ system provides comparable clinical accuracy in men and women.

We have been impressed by the technological advance of the HyperQ system and appreciate the convenience of having a hybrid system that includes both standard stress ECG components and the HyperQ analysis. The user-interface is intuitive and friendly, and our staff quickly transitioned to using the HyperQ system and prefers it over our previous stress ECG system.

BSP provided excellent service during the installation and training on use of the HyperQ system and have been exceptionally receptive to our needs. The personalized service we received far exceeded our expectations.

I look forward to working with you and BSP in advancing the study of this innovative technology and its adoption.

Sincerely,

A handwritten signature in black ink, appearing to read "O. Ben Yehuda".
