

“Non-invasive detection of inducible myocardial ischemia is of extreme importance in the daily practice of cardiology. Efficient and accurate assessment for ischemia with the HyperQ system may improve upon other noninvasive diagnostic tests, reduce costs to the healthcare system, and protect patients from unnecessary radiation exposure. “

“The HyperQ system is impressive- the hybrid system includes both standard stress ECG components and the HyperQ analysis.”

“The HyperQ system can be used during standard exercise stress testing and stress echocardiography, and features such as connectivity to automatic blood pressure measuring devices enhance the system’s functionality. The user-interface is intuitive and friendly. “

Jared M. Widell, M.D., F.A.C.C.
